How 3 minutes can help protect
your smile *for a lifetime!*

Are Your Teeth Important To You?

Properly cared for, your teeth can last you a lifetime. *Do you want to keep them?*

Adults mainly lose teeth from periodontitis (gum disease). It is a very common condition that most of us will suffer from during our lives. It tends not to be painful. An early sign is bleeding gums. Left untreated, gum disease destroys the bone and ligaments that hold your teeth in your mouth.

Can I do anything about it? YES! Gum disease can be controlled or prevented, but you need to identify it early. You may need regular hygiene appointments and a high standard of home care.

Does gum disease impact upon general health?

Yes. People with healthy gums have lower risk of stroke & heart attack, and better diabetic control.

Take Just 3 Minutes To Find Out Your Scores

Do you have gum disease? *What is your risk* of developing it? It is a silent disease that you may not know you have or are susceptible to. But if you identify it before it has a chance to cause damage, YOU can take control.

Now, through a simple, inexpensive *3 minute* test, your dentist can provide you with a personalised report that tells you exactly where you stand.

PreViser uses an objective, computerised model shown to accurately predict your risk. It calculates scores for your risk (1-5) and disease (1-100) levels that allow you to check, monitor and manage your way to better oral health.

Your Health; Your Choice

Your dentist takes pride in his / her preventive approach and has selected the very latest technology to protect your oral health.

We all know that prevention is better than cure. And that your own teeth are far superior to the expensive replacements that you will need if you lose them. Your oral health and the effort you make is up to you, but your dentist can now help you assess your options with the help of PreViser.

Ask your dentist to tell you about periodontal health and PreViser.

Your smile will thank you for it.
